

Nuclear Energy in Arkansas

July 2009

Arkansas' Electricity Generation

Nuclear	25.7%
Coal	47.3%
Oil	0.1%
Gas	15.2%
Hydro	8.8%
Renewable and Other	3.0%

Clean Air and Economic Benefits

Economic Growth and Emission-Free Electricity

Arkansas has experienced an average growth in gross state product of 1.4 percent per year over the past five years. To keep Arkansas' economy growing, the state will need new sources of power. At the same time, parts of Arkansas must deal with poor air quality. Emission-free sources, like nuclear power plants, supply safe, reliable and affordable power to meet the state's economic growth without polluting the air.

Nuclear Energy Prevents Emissions

Generating electricity with emission-free nuclear energy rather than combustion of fossil fuels avoids the emission of pollutants like sulfur dioxide (SO₂) and nitrogen oxides (NO_x) and greenhouse gases like CO₂. The nuclear power plants in Arkansas avoided the emission of 18,300 tons of SO₂, 13,000 tons of NO_x and 10.6 million metric tons of CO₂ in the year 2008 (Source: NEI/EPA). Emissions of SO₂ lead to the formation of acid rain. NO_x is a key precursor of both ground-level ozone and smog. Greenhouse gases like CO₂ contribute to global warming.

Nuclear Energy in Arkansas

Page 2 of 2 – July 2009

For perspective, the 13,000 tons of NO_x avoided by the nuclear power plants in Arkansas is the amount of NO_x released in a year by 683,000 passenger cars. There are 944,000 cars registered in the state of Arkansas.

Potential Uprates at Nuclear Plants

With additional capital investment, more emission-free power can be generated at most existing nuclear power plants. This process of increasing power output capacity is called an “uprate.” According to an analysis performed for the U.S. Department of Energy, uprates at Arkansas’ nuclear power plants could supply 2 percent more electricity and avoid annual emissions of 700 tons of SO₂, 200 tons of NO_x and 260,000 metric tons of CO₂.

New Nuclear Plants

The U.S. Energy Information Administration predicts that demand for energy will grow 21 percent by the year 2030. To meet this growing electricity demand in a manner that is cost effective and protects our air quality,

energy companies are planning to build nuclear power plants to provide affordable electricity to consumers and prevent greenhouse gases.

Economic Growth & Job Creation

Nuclear energy is one of the few bright spots in the U.S. economy because it creates more high-paying jobs than other sources of electricity and helps stimulate the economy. On average, a nuclear power plant creates 1,400-1,800 high-paying jobs during construction, with peak employment estimated as high as 2,400 jobs during that period, and yields 400-700 jobs during the operation of the plant. Additionally, the average nuclear plant generates approximately \$430 million a year in total output for the local community and nearly \$40 million per year in total labor income.
